Ipro Review 2019.7.0 Search Syntax Quick Reference

This document presents basic information on performing a search in the Ipro Review module. For the most up-to-date version of Ipro Review Help, go to the Ipro Help Center.

Basic Search Operators

Search for…[1]	Syntax	Examples
All words or phrases listed	and	smith **and** deficit **and** profit
Any of the words or phrases listed	or	profit **or** deficit **or** revenue.
Records that do *not* include a particular word or phrase	and not or not not	profit **and not** deficit profit **or not** deficit **not** profit
A phrase (expression or specific group of words in a specific order) [2, 3]	space " "	john smith (john smith) "profit and deficit"

1 All indexed words in all indexed fields (that you have right to view) of all records are examined.
2 Parentheses help clarify a search; they can also be used with field names.
3 Quotation marks ensure connector words are considered in the search.

Field-specific Search[4]

Search for…	Syntax[5]	Examples
Records in which specified field contains specified term or phrase	contains	to **contains** (jane smith) to **contains** (smith or hall)
Records in which specified field does not contain specified term or phrase	contains *? and not	author **contains** (*? **and not** brenner)

4 Field searching applies when field is included in the full-text index. For more information on Field-Specific Searches, see Define a Field-Specific Search on the Ipro Help Center.

Wildcards

Search for…	Syntax	Examples
Data containing zero or more characters in the asterisk's location	*	automo* phi*p
Data containing a single character in the question mark's location	?	su?anne
Data containing a single digit in the equal sign's location	=	ABC===2

Date Field Search[4]

Note: Enter date in the format YYYYMMDD, regardless of the format that appears in the case. For example, the case may show 12/03/2000; you should enter 20001203.

Search for…	Syntax[5]	Examples
Specific date	contains	creation date **contains** (20081222)
All dates except a specific date	contains *? and not	creation date **contains** (*? **and not** 20081222)
A range of dates	contains ~~	creation date **contains** (20010101~~20081231)

Simplifying the Process from Discovery to Trial

Proximity Search

Note: A type of full-text search that specifies how close two (or more) words must be to each other in order to qualify as a search result.

Except for first- or last-word proximity searches, proximity searching spans fields; results may, occasionally, be unexpected.

Search Type	Search for…	Syntax	Examples
Within	Two words within a specific distance[6] from one another	`w/`	`profit` **`w/5`** `loss`
Not within	Two words no closer than a specific distance	`not w/`	`profit` **`not w/`**`5 loss`
Before	A word that precedes another word by a specified amount	`pre/`	`profit` **`pre/`**`5 loss`
First-word proximity	A word that is near the first word in a field by a specified amount	`w/# xfirstword`	`profit` **`w/5 xfirstword`**
Last-word proximity	A word that is near the last word in a field by a specified amount	`w/# xlastword`	`profit` **`w/5 xlastword`**

6 Distance or amount = number of words apart.

Approximate Strings

Search Type	Search for…	Syntax	Examples
Fuzzy[6]	Terms approximately matching a pattern	`%`	`aut`**`%%`**`mobile`
Phonic	Terms that sound similar but are spelled differently	`#`	**`#`**`smith`
Stemming	Terms and all words beginning with the root form of the word	`~`	`operation`**`~`**

6 Advanced Search is often better for fuzzy searches (but you can use a quick search). The number of % characters determines the number of differences to be ignored during a search. Position determines how many letters at the start of the word have to match exactly. Results may vary, depending on such factors as the length of the search term and/or position of incorrect characters.

Extracted Text

Limit a search to extracted text using the following syntax.

- `//TEXT contains (term)`
- `//TEXT contains (term1 or term2)`
- `//TEXT contains (term1 and term2)`

Multi-part Search Expressions

- Search expressions can include several parts operations are performed in sequence from left to right.
- If you use more than one connector (and, or, not, etc.), use parentheses to precisely indicate the search.
- The use of nested parentheses is supported, but as with mathematical expressions, take care to ensure correct construction.

Example	Description
`(annual or profit) and deficit`	This search first creates a set of documents containing either `annual` OR `profit` (in any field) and then reduces that subset to only those documents that ALSO contain the word `deficit`.
`annual or (profit and deficit)`	This search first creates a set of documents containing `annual` and then adds to that set any documents containing both `profit` AND `deficit`.
`(jones or (smith and hall)) and not (carpenter or blakely)`	This search first creates a set of documents containing `jones` and then adds to that set any documents containing both `smith` AND `hall`. It then removes from the set any records containing either `carpenter` OR `blakely`.
⊘ `(profit and deficit) w/10 (smith and jones)`	DO NOT USE! This is an example of an ambiguous search. Ambiguity can particularly occur when the `W/` connector is used in a muti-part search. In general, at least one of the two expressions connected by `W/` must be a single word or phrase or a group of words and phrases connected by `OR`.
