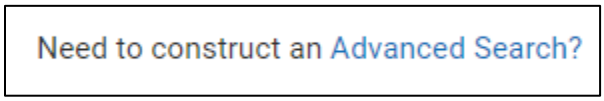
Advanced Search Window

Opening Advanced Search

The link to Advanced Search is located at the top of the Visual Search Dashboard.



- The Advanced Search window consists of two tabs:

Basics

The basic commands are located at the top of the Advanced Search window.

- **Link to other modules**

- **Case Name**

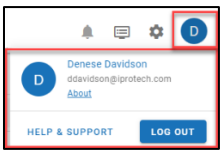
- **Links to:**

Notifications:

Job Manager:

System Settings:

- **User Info and Help**



- **Advanced Search Title:**

  - Untitled indicates cleared search.

- **Link to Visual Search**

After you have built and saved an **Advanced Search**, you can toggle to Visual Search to view the search results in the dashboard charts.

- **Search commands**

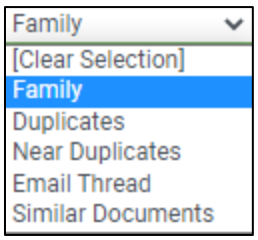
  - Click ***New*** to start a new search
  - Clicking ***Search*** runs the search.
  - Clicking ***Save*** will save the Search.
  - Clicking the Down Arrow will open the ***Save As*** option .

- **Search Results**

  Search results are located in the Results tab.

- **Relationships**

To include documents related to the search results, you can select a relationship type from the [**SELECT**] drop-down menu.



Search Criteria

Under Search Criteria, areas can be expanded as required to define the search and/or search options.

- Click the corresponding arrow next to each search criteria to expand or to hide.

Timeline

The Timeline initially depicts all dates found in the selected document set, from the earliest to the latest.

- The search Field drop-down menu and Filter Dates fields are at the top of the Timeline. The left field is the starting date and the right field is the ending date. Either enter or select the required dates in these fields.

To Select Dates:

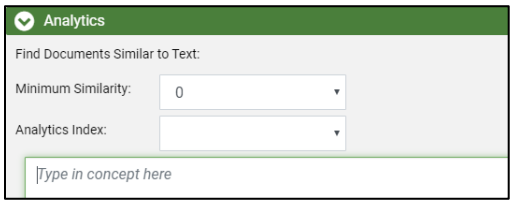
- To enter dates, use the format MM-DD-YYYY.
- To select a date from a calendar, click the calendar icon and the date of interest. Use the arrow buttons in the calendar heading to scroll backward or forward one month at a time.
- Drag right or left as required to define the range of interest.
- Select the **Include Empty & Invalid Dates** option to include into the document set documents that contain date problems

As soon as you select dates, the search results will change to reflect what was selected.

- To reset the Timeline entries, click RESET.

Analytics

A concept search returns documents that contain information that is conceptually similar to your search query, that is, it looks for ideas rather than specific terms or phrases.

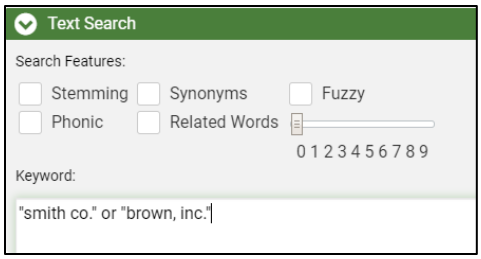


Concept Search Actions:

- Enter your query into the **Concept** field. The query can be any size, but a more fully described concept will usually yield better results than just one or two terms.
- Select a relevancy threshold to be used for the search
- Select an analytics index.

Text Search

Text searches can be complex or simple.



Text Search Actions:

- Enter any full-text search term or phrase in the Keyword field
- Select any of the **Search Features** as needed.

Field Search

You can limit a search to a specific field, or create a specialty search using the available search types.

Field Search Actions:

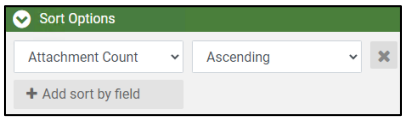
-

If two or more statements should be grouped into an expression you need to use parentheses.
- 
Select the required Search Type from the list—either a field name or one of the special search types.
- 
Select the required Operator. Operators vary depending on the Search Type chosen. They are presented in plain language for easy understanding.
- 
Values are entered based upon the search type and operator selected.

- 
To include another search statement in this area, select the required connector (And, Or, Not) on the right side of the statement, then click + and add another search statement.

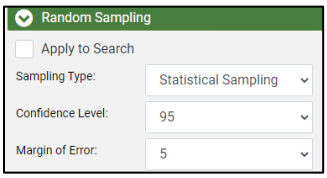
Sort Options

This section of the Advanced Search tab allows you to organize (sort) search results based by field content (the columns in the case table). Up to three fields can be defined for sorting.



Random Sampling

When Random Sampling is used, the search returns a random sample of documents instead of all documents meeting your search criteria.



Random Sampling Actions:

- **Sampling Type:**
  - Statistical Sampling - based on standard statistics calculations that use a confidence level and margin of error.
  - Fixed Size - creates a sample containing a specific number of documents in the search results.
- **Confidence Level:**
  - Confidence level represents the reliability of an estimate, that is, how likely it is that the sample returned will be representative of all search results.
  - The larger the confidence level is, the narrower the range of documents will be that are considered to be representative.
- **Margin of Error:**
  - The margin of error expresses the amount of error to be allowed in the search results sample.

Administration

The buttons located on the left of the window access additional administrative options. Depending on the individual permissions, the buttons that are viewed may be different.

Opens Saved Search and Smart Folders window

Opens Keyword Management

Opens Review Pass Management

Opens TAR Projects

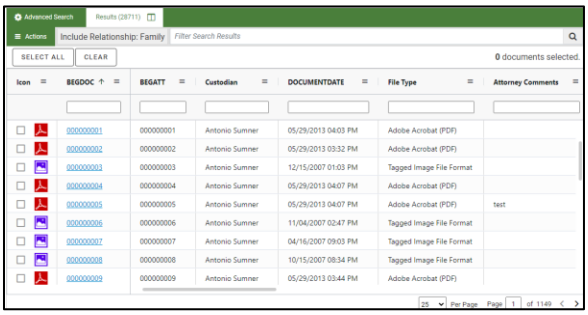
Opens Export Sets

Opens Analytics Settings

Opens Case Settings

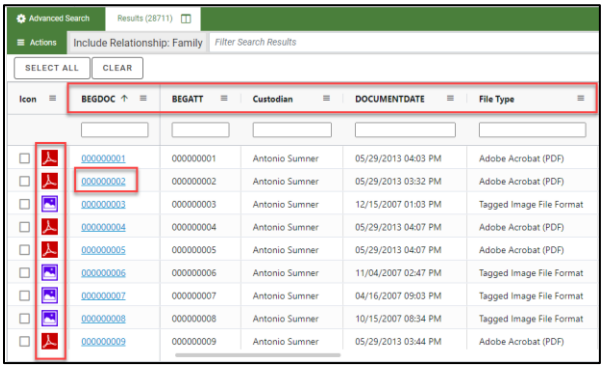
Results Grid

Click the **Results** tab to display the Search Results grid.

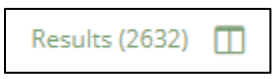


Navigation

The item/document list contains an icon for the native file type (unknown file types display), BEGDOC link for each item, and column fields that were selected for the Case's coding form.



- On the **Results** tab, the number of documents meeting the search criteria display in the **Results** tab in parenthesis.



- Click to view the Advanced Search window and the Results Grid side by side.

RESULTS GRID COLUMNS

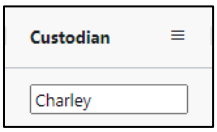
Columns (the fields and tag groups included in the grid) can be manipulated in the following ways:

SORT OR FILTER DOCUMENTS

- Click the Column Heading to open the Sort option. This allows you to sort ascending or descending.

To filter search results based on column data:

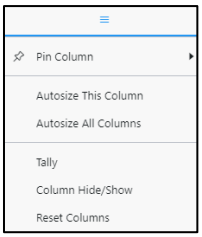
- In the heading of a column you want to filter, enter the term in the filter box.



Click Enter to run the search. The filter search will appear above the grid.

GRID VIEW OPTIONS

You can customize your grid view by clicking ≡ in the column heading. This opens the grid view options.



Pin Column

- Includes options to pin left or right.

Autosize This Column

- Change the column width based on the data.

Autosize All Columns

- Change all column widths based on the data.

Tally

- Provides a count of the occurrences of a value within the selected field. Tally results can be sorted and exported as a .csv file

Column Hide/Show

- The BEGDOC column displays by default. This applies to all columns except the leftmost column (the Native File Link column).

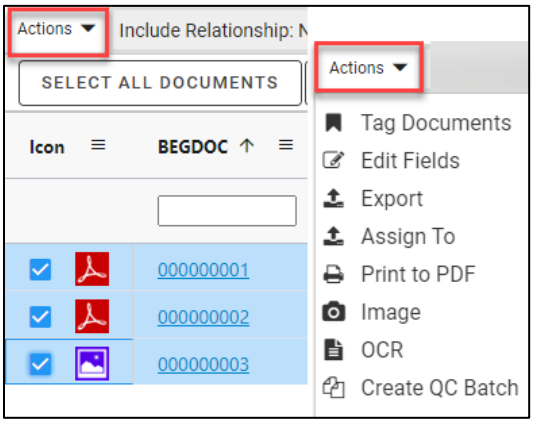
REPOSITION COLUMNS

- To move a column to a different position, point, click and drag the column to the desired location.

CHANGE COLUMN SIZE

- To change column width:
  - Place the mouse pointer on the column boundary. The cursor changes to ⟷.
  - Drag the column boundary to the left or right to change the column width as required. Up to 200 characters can display in a field; data will wrap if it contains spaces.

Each time you change the columns in the grid, the changes are saved as your user preference.

MASS ACTIONS


You can perform mass actions on one, some, or all of the documents located in the grid by selecting the check box for each document. At least one document must be selected in order to perform a mass action.
